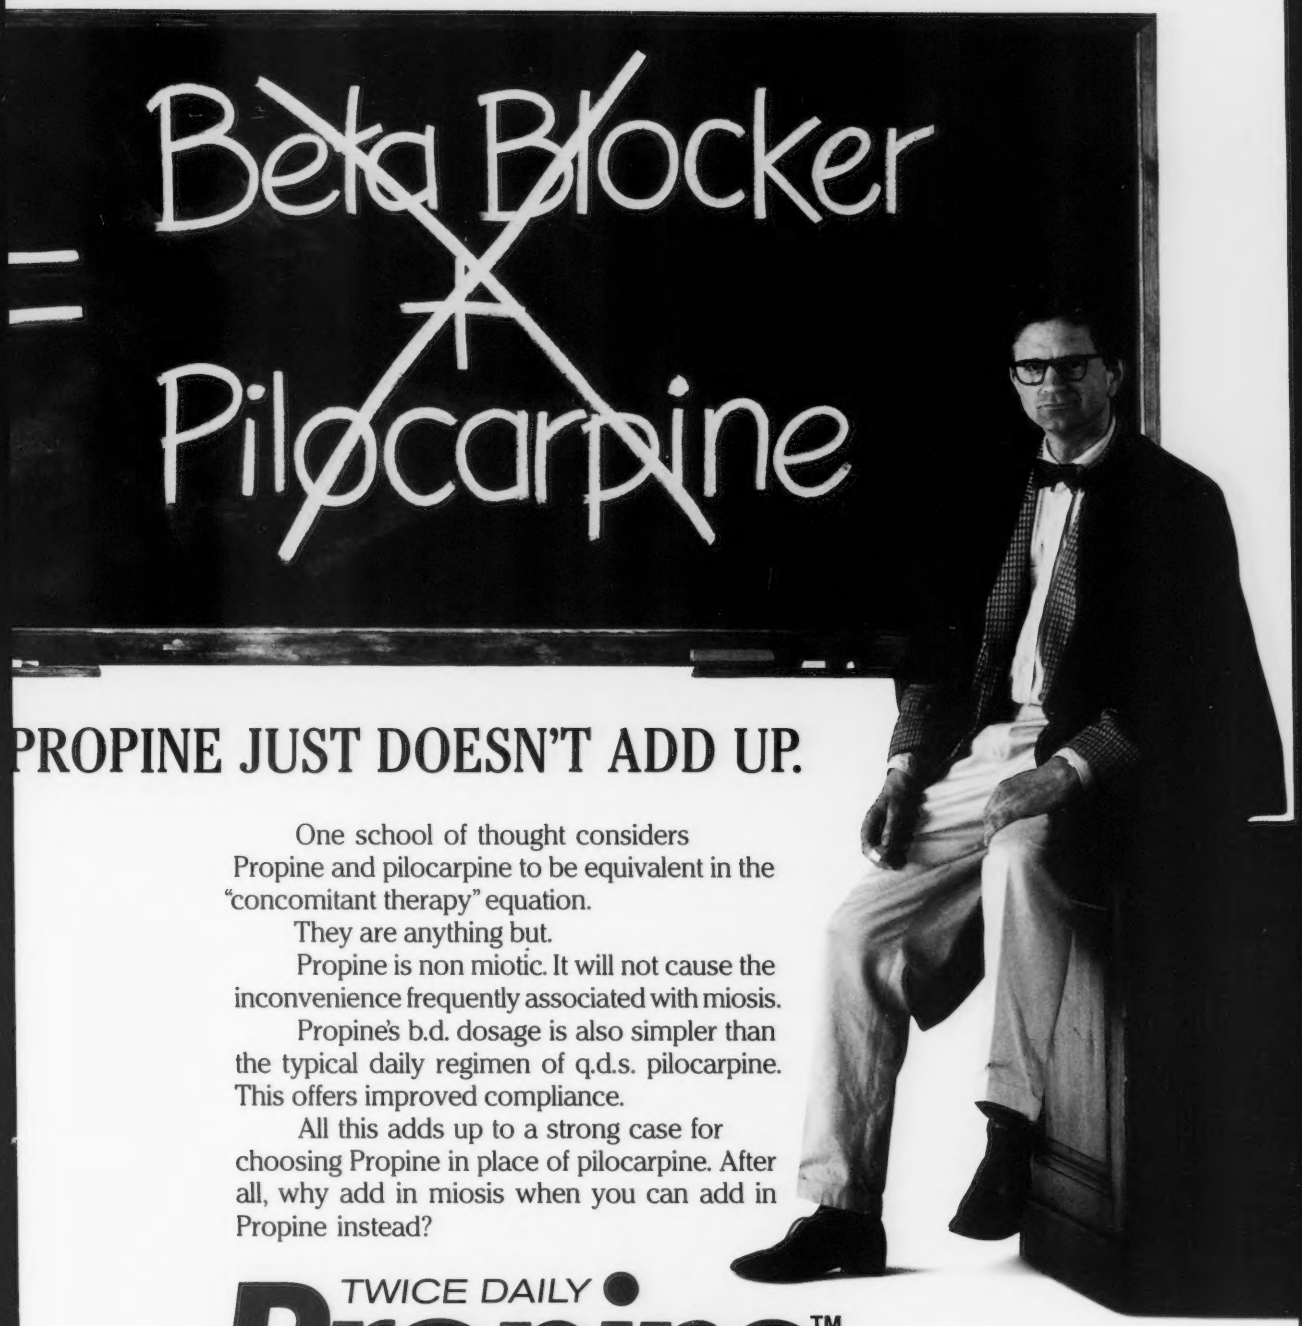
EQUATING PILOCARPINE WITH

PROPINE™ Prescribing Information

Presentation Sterile ophthalmic solution containing dipivefrin hydrochloride USP 0.1% (w/v). Also contains benzalkonium chloride Ph Eur 0.005% (w/v), disodium edetate Ph Eur 0.015% (w/v), with sodium chloride Ph Eur and purified water Ph Eur. **Uses** Propine is indicated for the reduction of intraocular pressure in chronic open angle glaucoma or ocular hypertensive patients with anterior chamber open angles. **Dosage and administration** The usual dosage is one drop in the affected eye(s) every 12 hours. **Contra-indications, warnings, etc.** *Contra-indications:* Patients suffering from angle closure glaucoma. *Use in pregnancy:* the safety of intensive or protracted use of dipivefrin during pregnancy has not been substantiated. *Precautions:* Dipivefrin should be used with caution in patients with narrow angles since dilation of the pupil may trigger an attack of angle closure glaucoma. Macular oedema is a rare occurrence with adrenaline use in aphakic patients. Prompt reversal generally follows discontinuance of the drug. Macular oedema with dipivefrin does present as a possibility in the aphakic patient. This product contains benzalkonium chloride and should not be used by patients continuing to wear soft (hydrophilic) contact lenses. *Side-effects:* Cardiovascular: Tachycardia, arrhythmias and hypertension have been reported with ocular administration of



PROPINE JUST DOESN'T ADD UP.

One school of thought considers Propine and pilocarpine to be equivalent in the "concomitant therapy" equation.

They are anything but.

Propine is non miotic. It will not cause the inconvenience frequently associated with miosis.

Propine's b.d. dosage is also simpler than the typical daily regimen of q.d.s. pilocarpine. This offers improved compliance.

All this adds up to a strong case for choosing Propine in place of pilocarpine. After all, why add in miosis when you can add in Propine instead?

adrenaline, and may occur rarely with Propine therapy. Ocular: the most frequently reported side-effects are conjunctival injection, and burning and stinging on instillation. Rebound vasodilation, mydriasis and allergic reactions, including blepharoconjunctivitis, have been reported occasionally. Adrenochrome deposits in the conjunctiva and cornea have been associated rarely with use of dipivefrin. Follicular conjunctivitis has been reported during long term therapy with Propine. The condition is reversible upon discontinuance of the drug. **Pharmaceutical precautions** Store at room temperature. Discard any unused contents 28 days after opening the bottle. **Legal category** POM. **Package quantities** Plastic dropper bottle containing 10 ml. **Further information** The active ingredient in Propine, dipivefrin HCl, is a prodrug of adrenaline. Its lipophilic nature facilitates penetration into the anterior chamber where it is hydrolysed to the active substance. Propine is a more efficient way of delivering adrenaline with fewer side-effects than associated with conventional therapy. Unlike cholinergic agents, dipivefrin has little or no effect on pupil size or accommodation, so the blurred vision and night blindness associated with miotics do not occur with Propine. **Product licence number** 0426/0040. **Basic NHS cost:** (as at February 1990) £4.89. **Date of preparation** February 1990.

What can you give a patient who suffers from amnesia as well as glaucoma?

Getting patients to comply with complicated dose regimens can be a frustrating business.

Which is why Allergan has developed Betagan, the beta blocker most patients only need to take once a day. This is possible because of Betagan's sustained activity over 24 hours,[1] which has been shown to be effective in controlling the intraocular pressure of up to 81% of patients on a once daily dose.[2]

In fact, in a study evaluating once-daily Betagan the authors concluded "once-daily treatment with levobunolol appeared to be as effective as twice-daily treatment while offering greater convenience and comfort and potentially greater safety."[3] So next time you're looking for a simple but flexible treatment for open angle glaucoma, consider Betagan.

It's a name worth remembering.

NEW BETAGAN®
